

Qarrar — Business Plan

1. Executive Summary

Qarrar (قرار, Arabic for "decision") is an Arabic-first, RTL-native SaaS platform that helps individuals and teams make better, more transparent decisions through weighted scoring, collaborative voting, and one-way finalization with a full audit trail.

While weighted decision matrices are a proven methodology (Pugh Matrix, 1970s), no existing product serves the Arabic-speaking market with proper RTL UX, regional compliance expectations, or governance-grade traceability. Qarrar closes that gap and layers an AI assistant on top to move the product from *calculator* to *advisor*.

Mission: Make group decision-making transparent, auditable, and culturally native for Arabic-speaking teams.

Vision: Become the default decision-intelligence platform for organizations across the MENA region and Arabic-speaking diaspora.

2. The Problem

- **Teams make high-stakes decisions opaquely.** Hiring picks, vendor selections, and project priorities are decided in chat threads and spreadsheets with no record of *why*.
- **Arabic speakers are underserved.** Existing tools (Melissa, DecisionApp, spreadsheets) are English-only with broken or absent RTL support.
- **Spreadsheets don't govern.** They calculate, but don't lock decisions, log who voted how, or produce an audit trail acceptable to compliance or board review.
- **Bias goes unchecked.** No existing consumer-accessible tool surfaces anchoring, groupthink, or low-confidence rating patterns.

3. The Solution

Qarrar turns any decision into a structured, traceable record:

1. **Frame** the decision as a question.
2. **Add options** (2–5) and **weighted criteria** (importance 1–5).
3. **Rate** each option per criterion — solo or as a team (per-user ratings averaged).

4. **Finalize** — one-way lock that freezes voting and edits, generates a rationale memo, and writes an immutable audit-log entry.
5. **Export** to PDF for records, or recycle (soft-delete) if abandoned.

Differentiators:

- Arabic-first RTL UX with full localization
- One-way finalization + audit log (governance angle)
- Team collaboration with invite codes and per-voter averaging
- Prebuilt templates (hiring, vendor selection, procurement, project priority, office location)
- AI layer: suggests criteria from free-text, flags bias, drafts justification memos

4. Market Analysis

Target market

Primary: Arabic-speaking knowledge workers and SMB teams (50–500 employees) in Saudi Arabia, UAE, Egypt, and the diaspora.

Market sizing (bottom-up, conservative)

- **TAM:** ~2.5M Arabic-speaking knowledge workers in decision-making roles across MENA + diaspora.
- **SAM:** ~600K workers in SMBs and mid-market teams that already use structured collaboration tools (Slack, Teams, Notion).
- **SOM (Year 3):** ~12K paid seats across ~1,800 teams (2% of SAM).

Trends supporting adoption

- Saudi Vision 2030 and UAE digital-transformation mandates push organizations toward auditable, transparent processes.
- GRC (governance, risk, compliance) budgets growing ~12% YoY in the GCC.
- Arabic NLP maturity (Jais, ALLaM) makes localized AI features viable for the first time.

5. Business Model

B2B SaaS subscription, per-seat pricing, monthly and annual billing.

Stream	Description	Share of Y2 revenue
Team subscriptions	Per-seat pricing for collaborative teams	70%
Pro (individual)	Power users and solo consultants	20%
Enterprise	Custom contracts, SSO, on-prem options	10%

6. Competitive Landscape

Competitor	Strength	Gap Qarrar exploits
Spreadsheets	Universal, free	No governance, no RTL, no AI
Melissa / DecisionApp	Polished UX	English-only, no team audit trail
Notion / Airtable	Flexible	Decisions are not a first-class object; no finalize-lock
- Loom surveys	Fast polling	No weighted scoring, no rationale

Defensibility: Arabic-first positioning, audit-trail moat (once an org's decision history lives in Qarrar, switching costs rise), and AI suggestions trained on regional decision patterns.

7. Go-to-Market

Phase 1 (Months 1–6): Land 10 design-partner teams (free, feedback-driven) in Saudi/UAE SMBs. Build case studies.

Phase 2 (Months 6–12): Public launch with Pro and Team tiers. Content marketing in Arabic (decision-framework blog, LinkedIn thought leadership). Target 200 paid teams.

Phase 3 (Year 2): Enterprise motion with SSO, custom templates, and compliance exports. Channel partnership with a regional HR/procurement consultancy.

See `marketing-strategy.md` and `sales-forecast.md` for detail.

8. Operations & Team

Year-1 lean team:

- 2 founders (product + GTM)

- 2 engineers (full-stack, Arabic NLP)
- 1 designer (RTL specialist)
- 1 part-time customer success

Infrastructure: Supabase (Postgres + Auth + Edge Functions), Vercel-style hosting, Clerk auth, OpenAI/Jais for AI features.

9. Financial Overview

See `sales-forecast.md` for the full model. Headline figures:

- **Year 1 ARR:** ~\$96K (200 teams, blended \$40/seat-month equivalent)
- **Year 2 ARR:** ~\$420K (900 teams + first enterprise deals)
- **Year 3 ARR:** ~\$1.3M (1,800 teams, enterprise expansion)
- **Break-even:** Month 22 (base case)
- **Gross margin:** ~78% (hosting + AI inference as primary COGS)

10. Milestones

Quarter	Milestone
Q1	MVP live, 10 design partners
Q2	AI criteria-suggestion shipped, public Pro/Team launch
Q3	100 paid teams, first case study published
Q4	200 paid teams, enterprise tier in beta
Y2 H1	SSO, audit-log export, 500 teams
Y2 H2	First enterprise contract signed, 900 teams
Y3	Channel partnership, 1,800 teams, break-even

11. Risks & Mitigations

Risk	Likelihood	Mitigation
Low willingness to pay in region	Medium	Anchor on governance value, not "productivity"; offer annual discounts
AI inference costs outpace revenue	Medium	Cache suggestions, use tiered models (Jais for Arabic, GPT for English)
Spreadsheet inertia	High	Templates + import-from-sheets; show audit-trail value to compliance owners
Larger player adds RTL	Low–Medium	Ship audit-trail moat fast; build community before competitors notice
Currency/payment friction	Medium	Support local payment methods (Mada, STC Pay) alongside Stripe
